Gist:

Information Systems were stand-alone systems during the 1950s and were used only as Transaction Processing Systems. Later on, it was also designed to address the needs of middle level managers giving rise to Management Information Systems for the presentation fortnightly data in predetermined format, and, Decision Support Systems with interactive query capability to address “What if analysis” to perform structured data analysis. ERP systems of today have the capability of intelligent decision making. Intelligence when embedded in decision making in computers is a major turning point. This talk is intended to address the ways by which how Artificial Intelligence can be made use of in the evolution of such systems and to what extent automation this is possible in decision making.
